MESSAGES BY MEMBER

WhatsApp Group Conversation Improvement Proposal

Proposal summary
A sender-based filter that helps users find messages, documents and media shared by one selected participant in a WhatsApp group.

Category
Group chat experience · Search and information discovery

Prepared as
Independent user feature suggestion · 2026

A simpler way to find exactly what you need from exactly who shared it.

1. Problem

Large WhatsApp groups often contain many participants sharing messages, PDFs, images, videos, links and announcements. In a school or college group, for example, several teachers may share learning materials. A student looking for one teacher's notes must search through content shared by many people, which can be slow and frustrating.

2. Proposed feature

Introduce an option called **Messages by Member** inside group information or group search. A user selects a participant from the current group by saved contact name or available phone number, then views only the messages sent by that participant.

3. Two filter modes

All Messages: show text, documents, PDFs, images, videos, links, voice messages and other supported message types from the selected member.
Documents & Media: show only supported files and media from that member, including PDFs, office documents, images and videos.

4. Suggested user flow

• Open a WhatsApp group.

• Choose "Messages by Member" from group information or search.

• Search for and select a participant.

• Choose "All Messages" or "Documents & Media".

• Optionally sort newest-first or oldest-first, and narrow results by date.

• Tap a result to jump to its original message in the group.

5. Use cases and expected benefits

Education: students find notes and assignments from a particular teacher.
Workplaces: employees locate reports and announcements from a colleague or manager.
Businesses: group members find quotations, invoices and product details from a specific participant.
Families and communities: users locate photos, videos and announcements shared by a particular member.

Expected benefits include less time spent searching, easier navigation in large groups, faster access to important material and a more organized group experience.

6. Privacy and technical considerations

The feature should respect WhatsApp's existing privacy and security architecture. It must not bypass group membership or message visibility permissions. End-to-end encryption should remain unaffected. Filtering should operate only on messages already available to the current user, should not expose private messages to other participants, and should preserve original timestamps and links to the original group context. Deleted or unavailable content should follow existing WhatsApp rules.

7. Request

I kindly request the WhatsApp product team to consider evaluating "Messages by Member" as a future group-chat improvement. It could help students, teachers, professionals, businesses, families and other users who rely on WhatsApp groups to share important information.

Core promise: A simpler way to find exactly what you need from exactly who shared it.
