MESSAGES BY MEMBER

WhatsApp Group Conversation Improvement Proposal

UX Proposal · 2026

PROPOSAL SUMMARY	A sender-based filter that helps users find messages, documents and media shared by one selected participant in a WhatsApp group.
CATEGORY	Group chat experience · Search and information discovery
PREPARED AS	Independent user feature suggestion for WhatsApp / Meta Product Evaluation

REVIEW ONLINE: 🌐 Project Homepage ↗ | 📱 Interactive Prototype ↗ | 💻 GitHub Repository ↗

PROPOSED 5-STEP INTERACTION WORKFLOW

1. Open Group → 2. Select Member → 3. Choose Filter → 4. View Results → 5. Open in Chat

1 Problem

Large WhatsApp groups often contain many participants sharing messages, PDFs, images, videos, links and announcements. In a school or college group, for example, several teachers may share learning materials. A student looking for one teacher's notes must search through content shared by many people, which can be slow and frustrating.

Keyword search requires remembering exact words or filenames, while the shared media gallery aggregates files chronologically across all members without sender distinction.

2 Proposed Feature

Introduce an option called **Messages by Member** inside group information or group search. A user selects a participant from the current group by saved contact name or available phone number, then views only the messages sent by that participant.

This allows members to bypass conversational chatter and immediately pinpoint essential files, assignments, or instructions contributed by a specific individual.

3 Two Filter Modes

Mode A — All Messages

Shows text, documents, PDFs, images, videos, links, voice messages and other supported message types from the selected member.

Mode B — Documents & Media

Shows only supported files and media from that member, including PDFs, office documents, worksheets, images and videos.

4 Suggested User Flow

- **Open a WhatsApp group** and tap group information or the search menu.
- **Choose "Messages by Member"** from the options list.
- **Search for and select a participant** by name, role, or phone number.
- **Choose "All Messages" or "Documents & Media"** based on current need.
- **Optionally sort newest-first or oldest-first** to order results chronologically. *(Note: Date range filtering is an optional proposed capability for future expansion).*
- **Tap a result** to jump directly to its original message in the group timeline.

5 Use Cases and Expected Benefits

Education: Students locate notes, slides and assignments from a specific teacher.

Workplaces: Employees find reports, circulars and notices from a manager or peer.

Businesses: Group members retrieve invoices, quotes and product details.

Communities: Members isolate photos, videos and official announcements.

Expected benefits include less time spent searching, easier navigation in large groups, faster access to important material, and a significantly more organized group experience.

6 Privacy and Technical Considerations (Proposed)

The feature should respect WhatsApp's existing privacy and security architecture. It must not bypass group membership or message visibility permissions. End-to-end encryption should remain unaffected. Filtering should operate locally on messages already available to the current user, should not expose private messages to other participants, and should preserve original timestamps and links to the original group context. Deleted or unavailable content ("Delete for Everyone", disappearing messages) should follow existing WhatsApp rules.

7 Request

I kindly request the WhatsApp product team to consider evaluating **"Messages by Member"** as a future group-chat improvement. It could help students, teachers, professionals, businesses, families and other users who rely on WhatsApp groups to share important information.

Core promise: A simpler way to find exactly what you need from exactly who shared it.

INDEPENDENT CONCEPT & PROTOTYPE DISCLAIMER:
This is an independent concept proposal and prototype. It is not an official WhatsApp feature and is not affiliated with, endorsed by, or connected to Meta or WhatsApp. The prototype uses fictional sample data and does not access real WhatsApp messages.
